Striker

Signed, sealed, swapped.

bonomat · Philipp | by satora.

Arkade Day · Lugano · 21 October 2026

01 WHY

Trade like a CEX. Keep your keys.

A swap is only as good as its price

- Fresh when you ask.
- Firm when you sign.
- The same for every user.

02 TODAY

Arkade Intents

How you swap on Arkade today

1 Intent
You say what you want to swap

→

2 Price
Your app prices it from the solver's feed

→

3 Fund
You fund an offer and wait

→

4 Fill
A solver watching the stream fills it

ARKADE

03 THE PROBLEM

Insert coin. Hope for a fill.

Anyone can list. Nobody has to fill.

- Solvers advertise markets in an open registry.
- A listing isn’t a commitment.
- You can’t see the liquidity behind it.
- **You fund first, and find out later.**

Your client does the pricing

- Pick a solver, read its price feed.
- Price the trade yourself.
- Give up a safety cushion, every trade.
- **Slow clients need a bigger cushion.**

Solvers trade from a hot wallet

- To fill, a solver keeps its inventory online.
- Whoever runs the solver controls all of it.
- **One compromised server, one empty wallet.**

04 THE SOLUTION

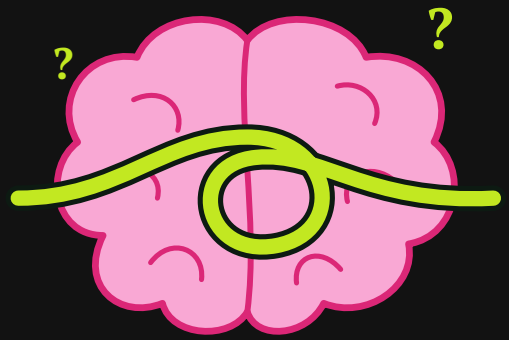

Price first. Pay second.

Definitions

ARKADE INTENTS

You are the maker.

You post an offer, then wait for a solver.

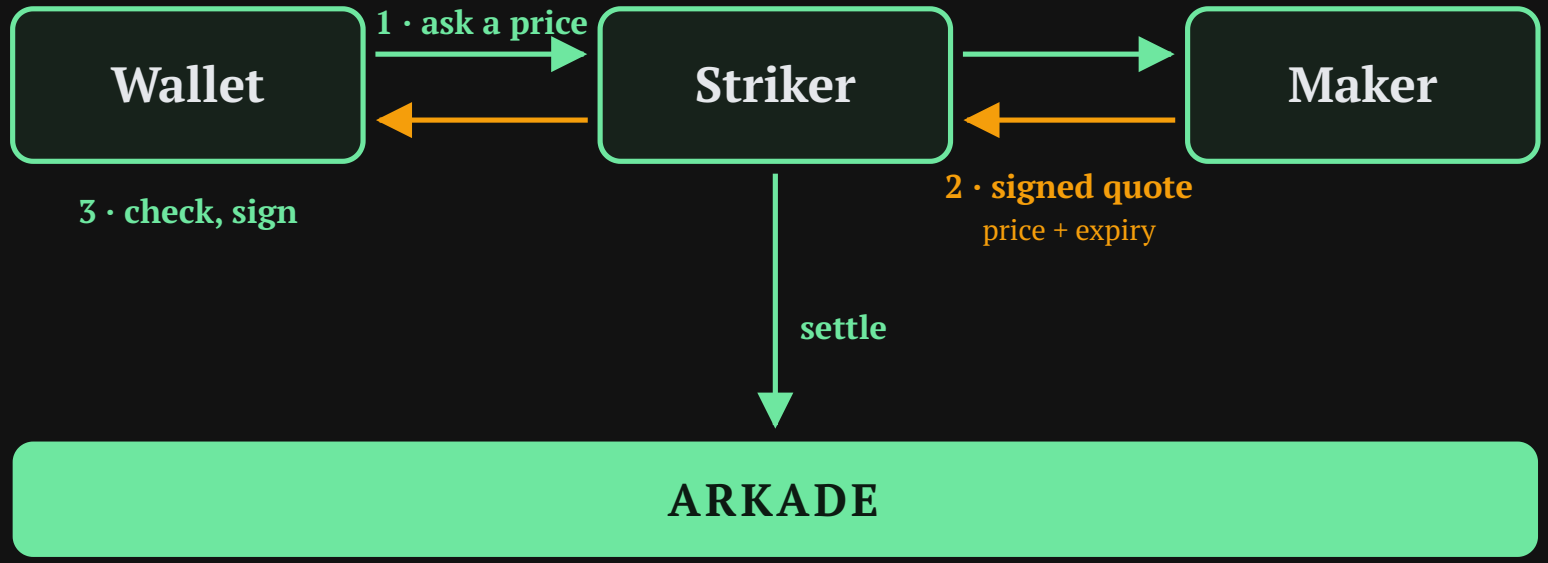

STRIKER

The maker is a **liquidity provider**.

It quotes you a price and commits to it.

Same word, flipped role. The commitment moves from you to the one with the liquidity.

Striker: ask, and get a signed quote

One request. A firm price. Then you fund.

The covenant: coins with rules

```
# pool script (simplified)
<maker_pk> OP_CHECKSIGFROMSTACK    # the maker signed this quote
quote.expiry > now                 # the quote hasn't expired
outputs pay the quote              # you get yours, the maker gets theirs
change -> same pool script         # the rest goes back into the pool

# witness
sig( "sell 2,000 USD for 0.02 BTC", valid 10 s )
```

Same script, smaller balance. One deposit, many fills.

The maker commits first.

	Arkade Intents today	Striker
Who sets the price	Your client, from a feed	The maker who fills
Before you fund	Nobody has committed	A signed quote, backed by a pool
Safety cushion	Every trade	None
Liquidity	Not visible	Public pool balance
Who shops for prices	Your client	Striker

Striker makes signed spot request enforceable.

Nobody has to trust Striker

- Striker can’t take your funds.
- Striker can’t change the price you signed.
- If a swap settles, it settles at the signed price.
- **Anyone can run a Striker. Anyone can run a maker.**

Separate roles, separate parties

No one is both the venue and the counterparty.

BTC ↔ demo USD

05 WHAT'S NEXT

Level up

Signed quotes open up more markets

Market	What the quote carries
Binary options	Strike, expiry, payout
Prediction markets	Event, odds
AMM-style pools	Price from a curve the maker computes
Futures	Mark price, margin terms

Build on Arkade

The maker commits first. The price lives in a signature.
